

★ SUMMARY

Full-stack software engineer with 12+ years building production software in healthcare and education, growing from project tech lead to trusted architectural advisor on a flagship product. Recent work centers on shipping AI-powered features, evaluating LLM output for accuracy and tone, and using AI-assisted development to solve deep reliability problems, work engineering leadership recognized as innovative. Known for turning hard-won knowledge into documentation, tooling, and patterns others build on.

★ EXPERIENCE

Panorama Education

May 2022 – Present
panoramaed.com

Lead Software Engineer

AI Survey Insights: Designed and shipped one of Panorama’s first user-facing AI features (Rails, Vue, TypeScript), which surfaces the most actionable findings in large survey datasets. Wrote prompts that weigh scores against national benchmarks, other questions, and past results, and link each insight back to its source data. Because educators act on these insights, tested output repeatedly with Product, Data Science, and Design for accuracy and neutral tone. Several large district clients, initially wary of AI, said they were “very impressed.”

Reporting Stability: Panorama’s flagship reporting product was hitting urgent issues roughly weekly from an outside vendor’s stateful analytics engine (Qlik). As incident commander on sev-1 outages, used AI to quickly learn the engine’s internals, then fixed the root cause by combining redundant requests and cutting unnecessary traffic. Stability improved markedly, with no comparable incident in the months that followed. Engineering leadership recognized the work as an innovative use of AI.

AI-Assisted Development: Use Cursor daily, choosing models per task and combining planning, debugging, and agent modes across multi-session work, verifying output carefully to tackle hard problems outside core expertise, such as race conditions and page-load timing.

Technical Leadership: Serve as a go-to advisor, alongside the engineering lead, on architecture, debugging, and design direction for the flagship reporting platform. Led a high-risk project to build on the company’s new Malloy data layer instead of Qlik, validating the approach with subject-matter experts first, and kept it ahead of schedule.

Cross-Team Delivery: As one of two leads for a multi-quarter reporting initiative spanning two teams, sequenced 5+ projects so both teams could build in parallel, and started cross-team working sessions to break down silos. The first releases reached pilot clients on time. Also tech-led the first client-facing release, delivered on schedule to positive client feedback.

Enablement & Mentorship: Wrote widely used playbooks that shortened ramp-up across the department, covering onboarding for new tech leads, safe rollbacks, report-data rebuilds, dev environment setup, and LLM-assisted debugging. Built a Qlik reload-log tool that made investigations easier, and coach peers toward surgical fixes rather than taking over their work.

Epic Systems

June 2014 – May 2022
epic.com

Senior Software Engineer

Full-Stack Clinical Software: Built safety-critical clinical software across the full lifecycle, from M (MUMPS) database code to C#/.NET and TypeScript/JavaScript web front ends. Led usability studies and design reviews, and was the go-to expert for several clinical modules.

Vaccine Inventory Rebuild: Led development after a major clinic customer considered uninstalling Epic’s vaccine inventory tool. Made the case for rebuilding it on a separate inventory platform, split the work into parallel tasks, led and mentored a growing team, and personally built the data conversion and rollback utilities. Shipped in February 2022; the same customer praised the “incredible improvements.”

Medication Record Web Migration: Key developer on moving the medication administration record, one of Epic’s largest projects, from desktop to web. Redesigned data loading to need a single database call per screen, dramatically improving performance; designed and ran the usability study; and led post-release stabilization, resolving 93 defects in six months.

COVID-19 Vaccine Rollout: Built patient-status tracking for vaccination workflows on expedited timelines and mentored teammates through the release. Received Epic’s 2020 Vision award for helping customers respond to the pandemic.

Insight Lab

February 2013 – August 2013

Assistant Director

Development & Leadership: Led lab staff, re-engineered science-education software, and built a staff management web app to close process gaps.

Goodrich ISR

March 2012 – August 2012

Software Engineering Co-op

Security & Trust: Built software for national-defense systems under strict security procedures. Passed a federal background check and was recognized company-wide for security-procedure knowledge during a federal audit.

★ SKILLS

★ Code

- TypeScript, JavaScript
- Ruby, Rails
- Vue 3, Ember, Angular
- C#, .NET, Java, Python
- M (MUMPS)
- HTML, CSS, Sass
- SQL & NoSQL databases

★ AI / LLM

- AI-powered feature development
- Prompt engineering
- LLM output evaluation & QA
- Multi-model evaluation & selection
- AI-assisted dev & debugging (Cursor)
- Unstructured data summarization
- LLM enablement docs
- Familiar with: Claude Code, Copilot, Windsurf, ChatGPT & web-based LLMs

★ Engineering

- Systems architecture
- Reactive SPA architecture
- State management (Pinia)
- Data fetching (TanStack Query)
- API development
- Qlik, Malloy
- GitHub, Codespaces, Docker, AWS
- Diagnostic tooling & observability
- Usability testing & UX design

★ Leadership

- Cross-team technical leadership
- Technical mentorship
- DEIB initiatives

★ EDUCATION

Rochester Institute of Technology

B.S., Software Engineering (Usability), May 2014 · Magna Cum Laude · Minors: Psychology, Game Design

★ CERTIFICATIONS

CAPM

Certified Associate in Project Management, PMI (earned 2016)
